The problem of global hunger plagues our world. Many countries in Africa and the middle east suffer from droughts causing crops to grow less efficiently. Climate change plays into this as the air gets more and more polluted from the amount of carbon being produced everyday, cutting back on the use of cars can lessen the pollution, instead using public transportation or even walking can make the environment more clean. In overpopulated countries in Africa and the middle east food scarcity is a big problem, with too many people there's not enough resources to provide for the entire population.

With the lack of food and water, the health of people in the middle east and Africa is declining, for example India is a very overpopulated country, with a high GDP india still struggles with poverty and country wide health care. India's big population dense cities produce a lot of pollution, the amount of cars and waste puts a lot of carbon in the air. With food banks and sustainable farming we can cut back pollution and have a cleaner environment.

Many European and Asian countries are under the threat of war. With the ongoing battles between Russia and Ukraine many european countries that don't want to get involved in the war are still funding Ukraine, the recent rase of military budgeting in most countries has caused problems, because of the race in military budgets money is going away from health care and other important areas causing more poverty and problems throughout Europe and Asia.

Overall, the solutions proposed to this issue in the committee prove fruitful to achieve a valid global goal.
